

Figure 1: Average unweighted survey responses to questions about intolerance toward religious outgroups across 25 multi-national survey series. Note, surveys pose different questions about religious intolerance across countries, as well as within countries over time; further, the number and timing of surveys varies cross-nationally. Panel A plots intolerance rates for the 30 countries with the largest share of intolerant responses; the *Years* column provides the range of years covered by the integrated surveys for a given country. Panel B maps average intolerance, split into terciles, by country. Panel C shows average intolerance rates by question-type in the full sample.

Figure 2: Coefficient plots of estimates from nine weighted least-squares regressions. Each regression employs a differently specified treatment variable, described in the panel titles and on the vertical axis. The unit of analysis is the respondent/question-item. Models include country, question-type, and question-target fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plot.

Figure 3: Subgroup effects. Estimates from weighted least-squares regressions that include country, question-type, and question-target fixed effects. The treatment variable is an indicator for whether the respondent was surveyed within six months prior to a national election. The unit of analysis is the respondent/question-item. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle.

Figure 4: Coefficient plots of four weighted least-squares regressions that include country fixed effects. The treatment variable is an indicator for whether the respondent was surveyed within six months prior to a national election. The unit of analysis is the respondent. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plot.

A Additional figures

Figure S1: Specification curve analysis assessing the robustness of the primary results to all combinations of modeling choices. The upper coefficient plot shows point estimates, ordered by magnitude, and 95 percent confidence intervals. Light blue coefficients are those for which the null hypothesis of no effect is rejected at the 95 percent confidence level. (In total, 14 out of 648, or 2 percent of estimates are statistically significant at the 95 percent level, and all significant effects are associated with negatively signed coefficients.) The lower plots show the analytical choices made—with each affirmative choice denoted by a black tick—in the generation of each vertically aligned coefficient in the upper plot. *Date precision* refers to the size of the time bracket within which an individual’s survey date can be accurately pinpointed. *Clustering* refers to the level at which standard errors are clustered.

Figure S2: Coefficient plots of estimates from weighted least-squares regressions for the four cross-regional survey series that have the largest overall samples. Regressions employ variously specified treatment variables, described on the right and left vertical axes. The unit of analysis is the respondent/question-item. Models include country, question-type, and question-target fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plots. Statistical significance is indicated on the left-hand sides of the plots: * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Figure S3: Coefficient plots of estimates from weighted least-squares regressions for each global region. Regressions employ variously specified treatment variables, described on the right and left vertical axes. The unit of analysis is the respondent/question-item. Models include country, question-type, and question-target fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plots. Statistical significance is indicated on the left-hand sides of the plots: * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Figure S4: Coefficient plots of estimates from weighted least-squares regressions for the four most numerous “target” religious groups (including “Different religion”) specified in the question-text. Regressions employ variously specified treatment variables, described on the right and left vertical axes. The unit of analysis is the respondent/question-item. Models include country and question-type fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plots. Statistical significance is indicated on the left-hand sides of the plots: * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Figure S5: Correlation plot visualizing the bivariate correlation coefficients between all pairs of nine country- or country/election-level variables used in the analysis of subgroup effects. The unit of analysis is the country/election year. There are 525 observations. For comparability, only country/election years that contain non-missing data for all nine variables are analyzed. *Democracy*, *Election system plurality*, *Election system P.R.*, *Religious conflict history*, *Last election competitive*, and *Religious party in national assembly* are the same dichotomous indicators employed in Fig. 3. *GDP per capita*, *Religious fractionalization*, *Religious polarization* are continuous measures: the underlying variables from which dichotomous subgroups are generated in Fig. 3. *Federalism* is not included due to high levels of missingness in the original measure.

Figure S6: Coefficient plots of estimates from nine weighted least-squares regressions analyzing the effect of election proximity on the probability of respondents offering a non-response to a question about religious intolerance. Each regression employs a differently specified treatment variable, described in the panel titles and on the vertical axis. The unit of analysis is the respondent/question-item. Models include country, question-type, and question-target fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plot.

Figure S7: Complete results for generalized social distrust, for the full sample of respondents. Coefficient plots of estimates from nine weighted least-squares regressions. Each regression employs a differently specified treatment variable, described in the panel titles and on the vertical axis. The unit of analysis is the respondent. Models include country fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plot.

Figure S8: Subgroup effects for the generalized social distrust outcome. Coefficient plots of estimates from weighted least-squares regressions. Each regression employs a differently specified treatment variable, described on the vertical axis. The unit of analysis is the respondent. Models include country fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle. The number of observations, with the number of countries in parentheses, is displayed on the right-hand side of the plots.

Figure S9: This figure presents binned scatter plots of the relationship between the stage at which individuals were surveyed in the course of the election cycle (in percentage terms) and whether they offered a negative attitude toward religious outgroups. In Panel A, I rank observations by their values on the treatment variable, and then split the data into 40 equally sized bins, according to this variable; next, I plot the bin-medians of the treatment variable against the bin-means of the outcome variable. Panel B follows the same procedure, except both variables are first residualized to partial out country, question-type, and question-target fixed effects. Blue lines represent loess smoothers through the binned data.

Figure S10: Histogram showing the distribution of the differences in mean intolerance rates between election periods and non-election periods, computed separately for each country.

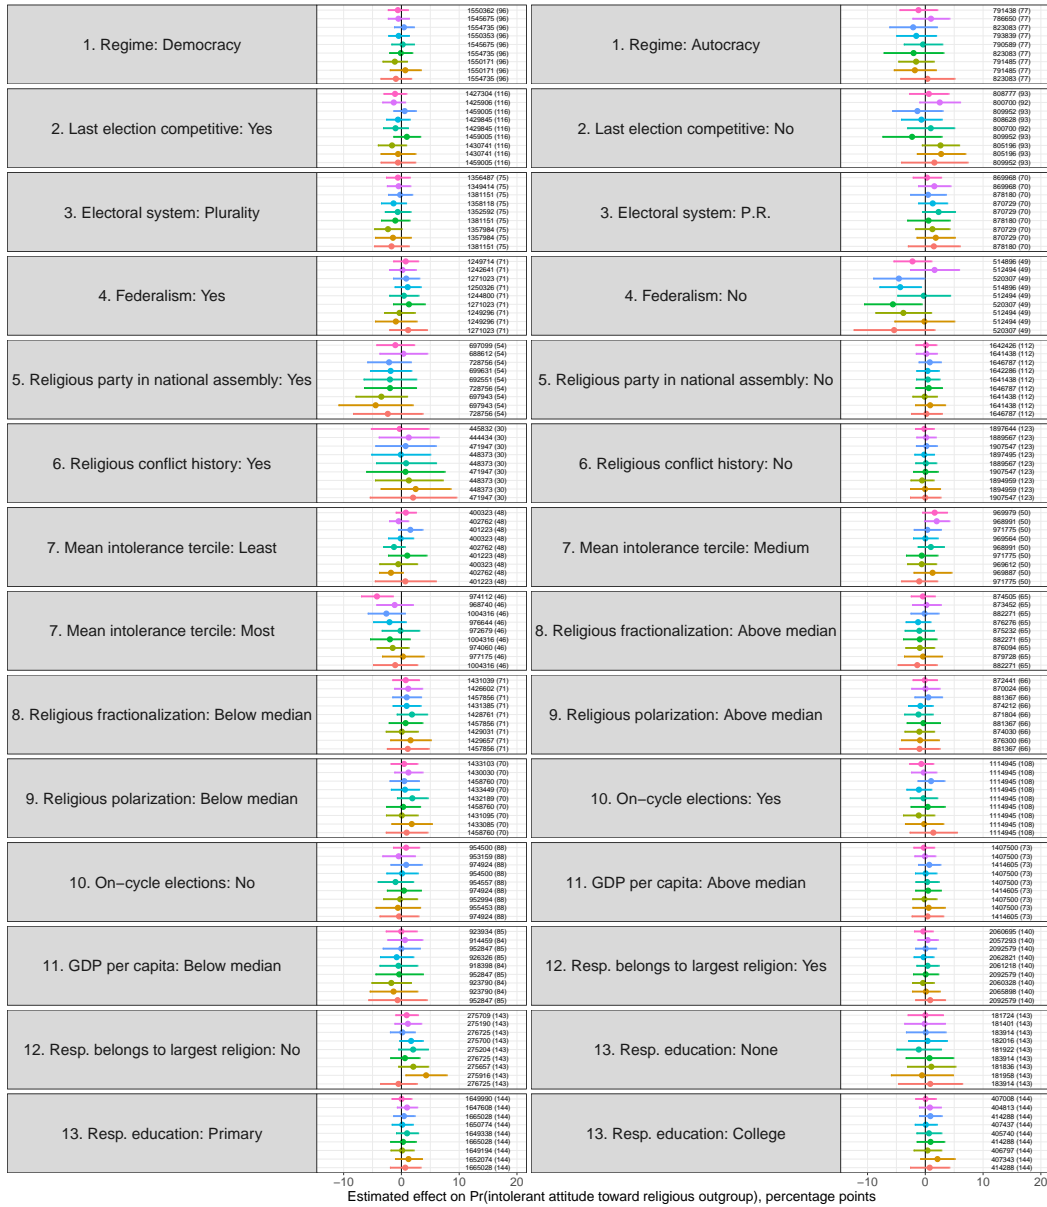

Figure S11: Complete subgroup effects. Estimates from weighted least-squares regressions that include country, question-type, and question-target fixed effects. Each subplot employs nine differently specified treatment variables (ordered as in Fig. 2). The unit of analysis is the respondent/question-item. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. 95 percent confidence intervals are based on robust standard errors clustered by country/election cycle.

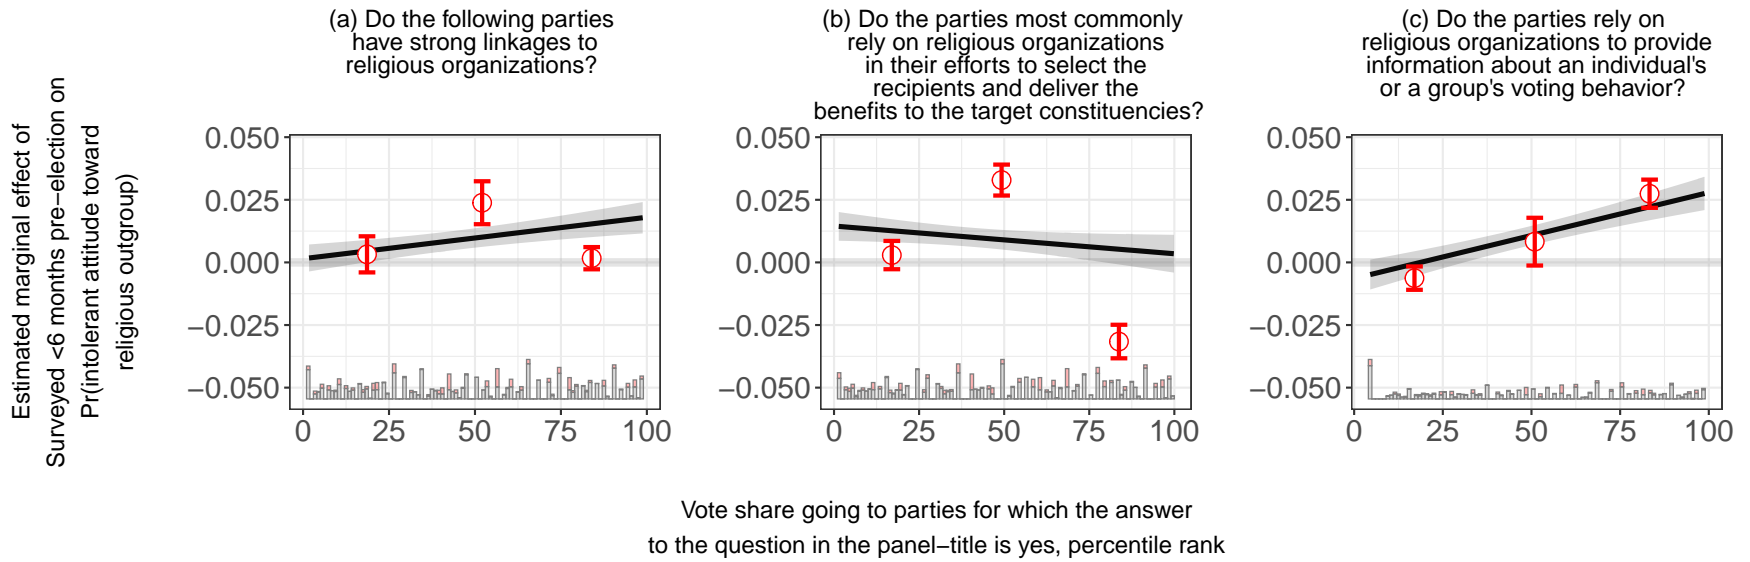

Figure S12: Estimated marginal effects according to the estimated national vote share received by parties with religious ties, as described in the Democratic Accountability and Linkages Project 2008. The unit of analysis is the respondent/question-item. Models include country, question-type, and question-target fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation.

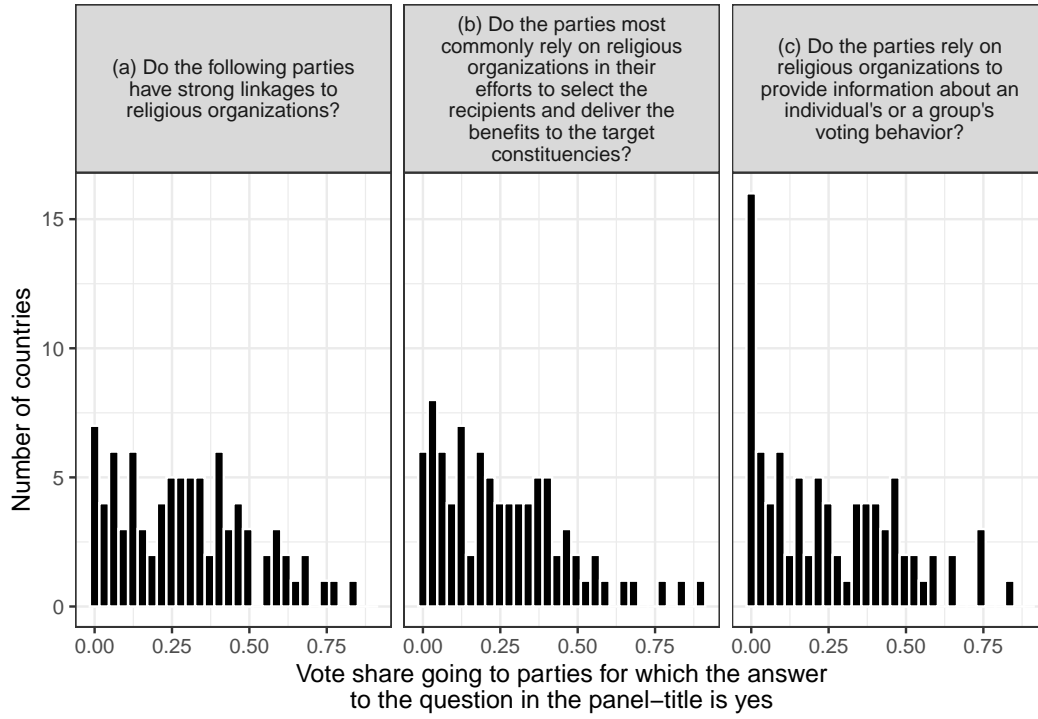

Figure S13: Histograms showing the distribution of vote shares received by parties with religious ties, as described in the Democratic Accountability and Linkages Project 2008.

B Additional tables

Table S1: Summary statistics. Detailed variable descriptions are provided in SI Appendix, Table S2. Variables are summarized at the level at which measurements were initially recorded.

Measure	N	Mean	St. Dev.	Min.	Median	Max.	Histogram
Outcome (question-item level)							
Intolerant attitude toward religious outgroup	2,576,234	0.31	0.46	0.00	0.00	1.00	
Generalized social distrust	821,742	0.66	0.47	0.00	1.00	1.00	
Religiosity	1,493,159	0.64	0.40	0.00	0.67	1.00

Table S2: Variables description and sources.

Variable	Data source(s)	Description
Individual/question-item outcomes		
<ul style="list-style-type: none"> • Intolerant attitude toward religious outgroup 	Compiled multi-national surveys; see SI Appendix, Table S8.	Across the surveys, four types of questions appear probing respondents' attitudes toward members of religious outgroups: willingness to have members of different religious groups occupy social roles at varying "distances" to the respondent—as neighbors, work associates, friends, citizens, or family members—as well as trust, favorability, and discomfort with respect to members of other religious groups. I recode responses dichotomously such that one always indicates that the respondent offered an intolerant attitude toward the religious group specified in the question wording, and zero indicates that the respondent offered a tolerant or neutral/indifferent attitude. All question-specific recodes are listed in SI Appendix, Table S12. Only responses for which the question inquired about a religion that was different from the religion with which the respondent identified are included in the dataset; this ensures that the dataset only captures attitudes toward religious outgroups.
<ul style="list-style-type: none"> • Generalized social distrust 	Compiled multi-national surveys; see SI Appendix, Table S8.	I focus on the question: "Generally speaking, would you say that most people can be trusted or that you need to be very careful in dealing with people?" This question—or variants of it—is available in most, but not all, survey instruments. I recode responses dichotomously such that one always indicates that the respondent offered a negative attitude (i.e. expressed generalized distrust in other people), and zero indicates that the respondent offered a positive or neutral/indifferent attitude.
<ul style="list-style-type: none"> • Religiosity 	Compiled multi-national surveys; see SI Appendix, Table S8.	Surveys probe the strength of individuals' personal religiosity in three ways: (i) by asking whether—or to what extent—the respondent considers themselves to be "a religious person"; (ii) by asking how important religion is in the respondent's life; and (iii) by asking about the frequency with which a respondent engages in religious practices (praying, attending religious services). I employ one measure of religiosity per respondent. Where surveys contain more than one type of measure, I use type (i) if available, or otherwise types (ii) or (iii) in that order of preference. Most surveys provide likert-style response options (e.g. 1 = Not at all important, 2 = Somewhat unimportant, 3 = Somewhat important, 4 = Very important). For simplicity, I assume equal differences between ordered categories, and rescale variables to take a value between zero and one, where zero indicates "not at all religious" and one indicates "very religious."
<ul style="list-style-type: none"> • Resp. reports having any religion 	Compiled multi-national surveys; see SI Appendix, Table S8.	This variable takes one if a respondent reported subscribing to any religion; it takes zero if the respondent reported being not religious (including if they reported being atheist or agnostic), or if they replied "don't know," "can't say," or refused to answer the question, or if the value for this variable is missing in the dataset for any other reason.

Table S2: (*continued*) Variables description and sources.

Variable	Data source(s)	Description
<ul style="list-style-type: none"> • Non-response to religious intolerance question 	Compiled multi-national surveys; see SI Appendix, Table S8.	This variable takes one if a respondent offered a substantive response to a question about their attitude toward religious outgroups; it takes zero if the respondent replied “don’t know,” “can’t say,” or refused to answer the question, or if the value for this variable is missing in the dataset for any other reason.
Individual treatments		
<ul style="list-style-type: none"> • Surveyed [X] months before and/or after an election 	Compiled multi-national surveys; see SI Appendix, Table S8. National Elections Across Democracy and Autocracy (NELDA) dataset; bit.ly/3Ng5YJo .	The dates on which individual respondents were interviewed are drawn from the original survey data. In instances where respondent-specific dates are not available, I input the individual’s survey date as the midpoint of the range of dates during which surveys were fielded in that country/round; this information is provided in the surveys’ technical documentation. For every individual, I then generate columns that contain the dates of the most recent (completed) and next upcoming national elections occurring in the country where the survey took place. Election dates are from the NELDA dataset. With this information merged, I then compute columns for (a) the number of days elapsed between the last election and the date on which the respondent was interviewed, and (b) the number of days between the date on which the respondent was interviewed and the next (forthcoming) election. Finally, I compute the suite of treatment indicators, dichotomously recording whether an individual’s survey date falls within a given time window—variously specified as three, six, or nine months—of a previous and/or forthcoming election. For each individual, this continuous measure is computed as: $(\text{Number of days since last election}) / (\text{Total number of days between next election and last election})$. See the previous row of this table for a description of how the component variables were derived.
<ul style="list-style-type: none"> • Percentage way through election cycle surveyed 	Compiled multi-national surveys; see SI Appendix, Table S8. National Elections Across Democracy and Autocracy (NELDA) dataset; bit.ly/3Ng5YJo .	For each individual, this continuous measure is computed as: $(\text{Number of days since last election}) / (\text{Total number of days between next election and last election})$. See the previous row of this table for a description of how the component variables were derived.
Individual characteristics		
<ul style="list-style-type: none"> • Female 	Compiled multi-national surveys; see SI Appendix, Table S8.	The variable takes one if the respondent identifies as female and zero otherwise (unless missing). This information is available in almost all surveys.
<ul style="list-style-type: none"> • Rural 	Compiled multi-national surveys; see SI Appendix, Table S8.	Most survey datasets contain a variable that captures the enumerator’s assessment of the type of settlement where the interview took place. To standardize across instruments, I generate a dichotomous indicator for “Rural.” This takes one in the following cases (and zero otherwise): (i) the terms “rural,” “country,” “countryside,” or “village” are used to describe the interview location; (ii) 10,000 people or fewer are reported as living in the settlement; (iii) in cases where the binned response-options do not include the number 10,000 for the population of the settlement, then the population-bin with the upper bound above and closest to 10,000 is considered “rural.” Settlements described as “refugee camps” are coded as not being rural.

Table S2: (*continued*) Variables description and sources.

Variable	Data source(s)	Description
<ul style="list-style-type: none"> • Education 	Compiled multi-national surveys; see SI Appendix, Table S8.	Surveys record individuals' educational attainment in a plethora of ways. I assign each respondent to one of three educational attainment categories, which can be discerned quite consistently across datasets. I code individuals as having "No education" if they did not complete a country's formal primary school curriculum (noting that the length of the formal curriculum varies across countries); where that information is not provided, I code individuals with fewer than 5 years (grades) of formal education as having "No education." Individuals who report having completed an academic (not vocational) bachelors/undergraduate degree, or a more advanced academic degree, are recorded as having attained a "College" education; where only number of years of education is provided, I code individuals with 15 or more years of education as having a "College" education also. All remaining individuals—those who completed a primary school education but did not complete a college education, under these definitions—are coded as having "Primary" education, meaning that this group's educational attainment ranges from completed primary education up to and including incomplete college education. Each category receives a dichotomous indicator in the dataset.
<ul style="list-style-type: none"> • Age 	Compiled multi-national surveys; see SI Appendix, Table S8.	Most surveys provide either respondents' precise age (in years), or their year of birth (from which age can be computed by knowing the year of the survey). Where surveys provide only a categorical age range (e.g. "27-35"), individuals' recoded age is imputed as the midpoint of the given range (thus, 31 in the "27-35" example). Where surveys provide categories that lack either an upper or lower bound (e.g. "75 and older," "20 or younger"), individuals' age is imputed as the <i>given</i> bound (thus, 75 and 20, respectively, in the examples just cited).
<ul style="list-style-type: none"> • Member of largest religion 	Cross-National Socio-Economic and Religion (CNSER) Data, 2011; bit.ly/3zmGXIm .	I use the RELRECOD variable from the CNSER data to code the largest religion for each country as Christian, Muslim, Jewish, Hindu, Buddhist, Shinto, or Other religion. I then create an indicator that takes one (and zero otherwise) in cases where a surveyed individual's self-identified religion matches the largest religion in the country where they reside.
<ul style="list-style-type: none"> • Surveyed in person 	Compiled multi-national surveys; see SI Appendix, Table S8.	Technical survey documentation and, in several cases, dataset variables were used to create an indicator that takes one if the respondent was interviewed face-to-face, in-person by an enumerator, and zero otherwise.

Country/election-level characteristics

<ul style="list-style-type: none"> • Regime: Democracy, Autocracy 	Varieties of Democracy (V-DEM) Project, version 12; bit.ly/3NcHP6t .	Variable derived from the V-DEM item, v2xregime: "How can the political regime overall be classified considering the competitiveness of access to power (polyarchy) as well as liberal principles?" The original V-DEM variable is coded for country/years and takes four levels. In my recode, I class "Autocracy" as comprising either the level "Closed autocracy" or "Electoral autocracy" in the original coding scheme, and "Democracy" as comprising either "Electoral democracy" or "Liberal democracy" in the original coding scheme.
--	--	--

Table S2: (*continued*) Variables description and sources.

Variable	Data source(s)	Description
<ul style="list-style-type: none"> • Electoral system: Plurality, P.R. 	Database of Political Institutions (DPI) 2020; bit.ly/3Tn5JiM .	I use the variable HOUSESYS from the DPI dataset, which codes the electoral rule (proportional representation or plurality) governing the election of the majority of national “house seats” in a given country/year. I generate a variable that takes one if the value of HOUSESYS is “Plurality” for a given country/year, and zero otherwise. I generate a second variable that takes one if the value of HOUSESYS is “Proportional representation (P.R.)” for a given country/year, and zero otherwise.
<ul style="list-style-type: none"> • Federalism 	Database of Political Institutions (DPI) 2020; bit.ly/3Tn5JiM .	I use the variable STATE from the DPI dataset, which codes whether state/provincial governments are locally elected or not for a given country/year. I generate a variable that takes zero if the value of STATE is zero (denoting that state/provincial governments are not elected), and one if the value of STATE is one or two (respectively denoting that the state/provincial legislature, or the state/provincial executive and legislature, are elected).
<ul style="list-style-type: none"> • Religious party in national assembly 	Varieties of Party Identity and Organization (V-Party) Dataset; bit.ly/3MbpGVt .	The V-Party dataset consists of expert codings of the characteristics of parties attaining more than five percent of seats in a country’s national assembly. The original unit of analysis is the country/election year/party. I use the variable, v2parelig: “To what extent does this party invoke God, religion, or sacred/religious texts to justify its positions?” I classify a religious party as one that is coded as “Always or almost always” or “Often, but not always” invoking God, religion, or sacred/religious texts to justify its positions. Finally, I generate a variable that takes one if there is any religious party in the national assembly in a given country/election year (and zero otherwise). To make a country/year panel, I fill this variable forward annually within country, until the next election is reached.
<ul style="list-style-type: none"> • Last election competitive 	National Elections Across Democracy and Autocracy (NELDA) dataset; bit.ly/3Ng5YJo .	Variable based on NELDA 12, which is dichotomous: “Was the incumbent or ruling party confident of victory before elections?” In the original dataset, “no” indicates that the incumbent was not confident of victory, indicating that the election was at least somewhat competitive. The final analysis variable takes one if the last election was coded as competitive according to this measure, and zero otherwise.

Table S2: (*continued*) Variables description and sources.

Variable	Data source(s)	Description
<ul style="list-style-type: none"> • Religious conflict history 	Religion and Armed Conflict (RELAC) Data; bit.ly/3nh49kk .	The RELAC dataset is an extension of the UCDP Dyadic Dataset of armed conflicts in the world between 1975 and 2015. Armed conflicts are defined as: “a contested incompatibility that concerns government and/or territory where the use of armed force between two parties, of which at least one is the government of a state, results in at least 25 battle-related deaths in a calendar year.” RELAC adds a newly coded column (RelIncomp) for “Religious Incompatibility,” capturing “whether there is a religious dimension in the original incompatibility as explicitly stated at the onset of the conflict by the representatives of the primary parties.” The dataset also provides a variable for the start date of each conflict. I keep all conflicts for which RelIncomp takes a value of one. Finally, in the analysis dataset, I generate a dichotomous variable indicating whether, at the time of the last election (in relation to when the respondent was surveyed), a country had previously experienced a religious conflict according to the RELAC dataset. Note, therefore, that this measure does not capture any conflicts that occurred prior to 1975.
<ul style="list-style-type: none"> • On-cycle elections 	National Elections Across Democracy and Autocracy (NELDA) dataset; bit.ly/3Ng5YJo .	Variable based on NELDA 6, which is dichotomous: “If regular, were these elections early or late relative to the date they were supposed to be held per established procedure?” In the original dataset, “no” indicates that the election was held on-cycle. The final analysis variable takes one if both the last and next elections (relative to the date of the individual survey) were held on-cycle, and zero otherwise.
<ul style="list-style-type: none"> • GDP per capita above median 	United Nations Statistics Division; bit.ly/3ze9Pm8	The UN provides a dataset of GDP per capita—at current prices in US Dollars—for all countries except Taiwan between 1970 and 2020. I limit the series to the years 1975 to 2020, which is the date-range of the first to last election that appears in the analysis dataset. For each year, I then categorize each country as above or below the median per-capita income for all countries in that given year.
<ul style="list-style-type: none"> • Election involved civilian deaths 	National Elections Across Democracy and Autocracy (NELDA) dataset; bit.ly/3Ng5YJo .	Variable based on NELDA 33, which is dichotomous: “Was there significant violence involving civilian deaths immediately before, during, or after the election?” The analysis variable takes one if there was such violence and zero otherwise.
Country-level characteristics		
<ul style="list-style-type: none"> • Mean intolerance tercile 	Compiled multi-national surveys; see SI Appendix, Table S8.	I take the average rate of religious intolerance toward religious outgroups by country, using the integrated survey dataset, across all available years. I then assign countries into terciles of intolerance using the ranking of these country-level averages.
<ul style="list-style-type: none"> • Religious fractionalization above median 	Composition of Religious and Ethnic Groups Fractionalization/Polarization Estimates dataset, produced by Steven V. Miller; bit.ly/3grYjfy .	I use the religious fractionalization measure from the Steven V. Miller dataset. The measure is an application of the Herfindahl-Hirschman concentration index, based on cross-national religious demographic data for the year 2000. I use the median value for the full set of countries to create a dichotomous variable indicating that a country’s value was above median.

Table S2: (*continued*) Variables description and sources.

Variable	Data source(s)	Description
<ul style="list-style-type: none"> • Religious polarization above median 	Composition of Religious and Ethnic Groups Fractionalization/Polarization Estimates dataset, produced by Steven V. Miller; bit.ly/3grYjfy .	I use the religious polarization measure from the Steven V. Miller dataset dataset. The measure is an application of the Montalvo and Reynal-Querol polarization index, introduced in Jose Montalvo and Marta Reynal-Querol (2005), "Ethnic polarization, potential conflict, and civil wars," <i>American Economic Review</i> 95(3), pp. 796–816. The calculation is based on cross-national religious demographic data for the year 2000. I use the median value for the full set of countries to create a dichotomous variable indicating that a country's value was above median.
<ul style="list-style-type: none"> • Linguistic fractionalization above median 	Alberto Alesina et al (2003). "Fractionalization." <i>Journal of Economic Growth</i> 8, pp. 155–194; bit.ly/3bl0Rtr .	I use the linguistic fractionalization measure from the original Alesina et al dataset. The measure is an application of the Herfindahl concentration index, based on data from various sources. I use the median value for the full set of countries to partition the data into above and below median values.
<ul style="list-style-type: none"> • Ethnic fractionalization above median 	Alberto Alesina et al (2003). "Fractionalization." <i>Journal of Economic Growth</i> 8, pp. 155–194; bit.ly/3bl0Rtr .	I use the ethnic fractionalization measure from the original Alesina et al dataset. The measure is an application of the Herfindahl concentration index, based on data from various sources. I use the median value for the full set of countries to partition the data into above and below median values.
<u>Fixed effects</u>		
<ul style="list-style-type: none"> • Country 		Fixed effects for each country.
<ul style="list-style-type: none"> • Question-type 		Fixed effects for the question types that describe the nature of the question asked regarding religious intolerance (various social roles, trust, favorability, discomfort).
<ul style="list-style-type: none"> • Question-target 		Fixed effects for the religion or sect specified in the question text for questions about religious intolerance, including for aggregate target groups such as "Different religion" and "Different sect."

Table S3: Weighted least-squares regression estimates of balance on individuals' pre-treatment characteristics. The unit of analysis is the respondent. Q-type and Q-target refer to question-type and question-target, respectively. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. Robust standard errors clustered by country/election cycle are in parentheses.

Table S4: Weighted least-squares regression estimates of the relationship between being surveyed within specified time-frames before and after a national election and expressions of intolerance toward religious outgroups. This table presents the results of nine separate regression models. Indicators for being surveyed before and after an election are entered simultaneously into the regression models. To assess robustness, different combinations of fixed effects are included, as indicated in the table header. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. In each model, observations are weighted such that each country/election cycle contributes equally in estimation. Robust standard errors clustered by country/election cycle are in parentheses.

Table S5: Tabulation of primary results displayed in Figure 2 of the main paper. Weighted least-squares regression estimates of the relationship between being surveyed within a specified time-frame before and/or after a national election and expressions of intolerance toward religious outgroups. The unit of analysis is the respondent/question-item. Models include country, question-type, and question-target fixed effects. Only responses for which the survey date can be accurately pinpointed to within a six-month time bracket are included. Observations are weighted such that each country/election cycle contributes equally in estimation. Standard errors are clustered by country/election cycle, and 95 percent confidence intervals are based on these.

Table S8: List and description of included survey series.

Source	Link to original data	Brief description	Target sample
A Cross-National Survey of Muslim Attitudes	bit.ly/3z8Wdsm	“The survey of Muslims was conducted on behalf of Arizona State University by Abt SRBI in Southeast Asia, West Africa, and Western Europe. The goal of the study is to investigate how Muslim individuals and communities respond to and counter radical or extremist actors in their discourses. It details religious attitudes and perceptions of the impact of the West on Muslim societies.”	Muslims only
Afrobarometer	bit.ly/3POesJs	“A pan-African, non-partisan survey research network that conducts public attitude surveys on democracy, governance, the economy, and society ... Our network encompasses more than 30 national partners responsible for data collection, analysis, and in-country dissemination of findings.”	Nationally representative
Arab Barometer	bit.ly/3sYWE4L	“Arab Barometer is a nonpartisan research network that provides insight into the social, political, and economic attitudes and values of ordinary citizens across the Arab world. We have been conducting high quality and reliable public opinion surveys in the Middle East and North Africa since 2006. We are the longest-standing and the largest repository of publicly available data on the views of men and women in the MENA region.”	Nationally representative
Arab Opinion Index	bit.ly/3BW50O3	“The Arab Opinion Index [is] an annual survey conducted by the Arab Center in order to gauge Arab public opinion around a number of political, cultural, and social topics. The program is headed by a specialist statistician, leading a team of research assistants and experts in survey methods.”	Nationally representative
Candidate Eurobarometer	bit.ly/3t46CBQ	“In October 2001, the European Commission launched a new series of surveys in the 13 countries that are applying for European Union membership under the heading Candidate Countries Eurobarometer ... The CCEB surveys gather information from the societies applying to become members of the EU in a way that is comparable with the Standard Eurobarometer.”	Nationally representative
Caucasus Barometer	bit.ly/3LVCeAm	“The Caucasus Barometer is an annually conducted nationwide survey in Georgia, Armenia and Azerbaijan that covers a wide range of social, economic and political issues in the region.” It is run by the Caucasus Research Resource Centers.	Nationally representative
Comparative Cross-National Study of Religious Fundamentalism, Developmental Idealism, Values, and Morality in the Middle East and North Africa	bit.ly/3ITiV00	Part of the Middle Eastern Values Study. “The objective of Middle Eastern Values Studies (MEVS) is to advance the social-scientific understanding of the causes and consequences of the values and the belief systems of the people of the Middle East ... The Middle East Value Studies began with a three-country survey ... in 2000-2001.”	Nationally representative
Comparative Panel Survey on the Dynamics of Change: Belief Formation and Political Engagement in Egypt, Tunisia, and Turkey	bit.ly/3ISnAiB	Part of the Middle Eastern Values Study. “The objective of Middle Eastern Values Studies (MEVS) is to advance the social-scientific understanding of the causes and consequences of the values and the belief systems of the people of the Middle East ... The Middle East Value Studies began with a three-country survey ... in 2000-2001.”	Nationally representative
CROSS-National Online Survey	bit.ly/3URDxpy	“CRONOS was designed and implemented alongside ESS Round 8 in 2016, as part of the larger SERISS project. After completing the ESS face-to-face interview, respondents in Estonia, Great Britain and Slovenia 18 or older were invited to participate in six 20-minute online surveys over a time period of twelve months.”	Nationally representative
Eurobarometer	bit.ly/3POLMQJ ; bit.ly/3wZktug ; bit.ly/3a30naM ; bit.ly/3z6D1eI ; bit.ly/3lWZIdQ ; bit.ly/3z78GwS ; bit.ly/3aji5XA ; bit.ly/3zbIH7z	“Eurobarometer is a series of public opinion surveys conducted regularly on behalf of the European Commission and other EU Institutions since 1973 ... The Standard Eurobarometer survey series is a cross-national longitudinal study, designed to compare and gauge trends within Member States of the European Union.”	Nationally representative

Table S8: (*continued*) List and description of included survey series.

Source	Link to original data	Brief description	Target sample
European Values Study	bit.ly/3IRIBdc	“The European Values Study (EVS) is a large-scale, cross-national, repeated cross-sectional survey research programme on basic human values. It provides insights into the ideas, beliefs, preferences, attitudes, values and opinions of citizens all over Europe.”	Nationally representative
Friedrich-Ebert-Stiftung Youth Studies in East Europe and Central Asia	bit.ly/3LZunlb	“These comprehensive studies capture youth attitudes, beliefs, and participation in core domains of life, including democracy, politics, governance, and the EU and also include sections devoted to education, employment, religion, family and lifestyles. Each nation used a questionnaire developed in 2005 for Germany’s Shell Youth Studies as a template and made modifications based on their country’s context to ensure relevance to particular intra-national issues.”	Nationally representative of youths aged approximately 15 to 27 (there are small variations in ages sampled across countries)
Friedrich-Ebert-Stiftung Youth Studies in Southeast Europe	bit.ly/3NJfcxY	“These comprehensive studies capture youth attitudes, beliefs, and participation in core domains of life, including democracy, politics, governance, and the EU and also include sections devoted to education, employment, religion, family and lifestyles. Each nation used a questionnaire developed in 2005 for Germany’s Shell Youth Studies as a template and made modifications based on their country’s context to ensure relevance to particular intra-national issues.”	Nationally representative of youths aged approximately 15 to 27 (there are small variations in ages sampled across countries)
International Social Survey Programme	bit.ly/38P0CGI ; bit.ly/3GtwkVS ; bit.ly/3PQFsbu ; bit.ly/3MXf25P	“The International Social Survey Programme (ISSP) is a collaboration between different nations conducting surveys covering topics which are useful for social science research ... The results of the surveys provide a cross-national and cross-cultural perspective to individual national studies. By 2021, 58 countries have already taken part in the ISSP.”	Nationally representative
LatinoBarometro	bit.ly/3a5jW24	“Latinobarometro is an annual public opinion survey that involves some 20,000 interviews in 18 Latin American countries, representing more than 600 million inhabitants ... [It] researches the development of democracy and economies as well as societies, using indicators of opinion, attitudes, behaviour and values.”	Nationally representative
Life in Transition Survey	bit.ly/3PLGeX3 ; bit.ly/3NEyzzb	“The European Bank for Reconstruction and Development ... in collaboration with the World Bank, has carried out three such surveys [on ‘how transition has affected the lives of people in regions, and what their views are on issues such as democracy, the role of the state, and prospects for the future’]: one in 2006, one in 2010 and one in 2016. The most recent polled 51,000 households in 34 countries, mainly ‘transition countries’ in central and eastern Europe as well as Turkey and also, for the sake of comparison with more prosperous western neighbours, from Germany and Italy. For the first time, the survey also covered Cyprus and Greece.”	Nationally representative
Perception and Acceptance of Religious Diversity among the European Population	bit.ly/3lWa5hX	“The Perception and Acceptance of Religious Diversity survey is one of the largest representative surveys to date on religious plurality in Europe. It captures the range of attitudes toward Islam and other religions among residents in five European countries. The survey was carried out in 2010 by the Cluster of Excellence ‘Religion and Politics’ of the University of Münster, together with TNS Emnid.”	Nationally representative
Pew Global Attitudes Project	pewrsr.ch/3wToJeP	“The Pew Global Attitudes Project is a series of worldwide public opinion surveys encompassing a broad array of subjects ranging from people’s assessments of their own lives to their views about the current state of the world and important issues of the day.”	Nationally representative
Pew Religious Belief and National Belonging in Central and Eastern Europe	pewrsr.ch/3NFXHyj	This survey is part of the “Pew-Templeton Global Religious Future project, which analyzes religious change and its impact on societies around the world ... The survey in Central and Eastern Europe was conducted via face-to-face interviews under the direction of three research partners ... The survey is based on samples of noninstitutionalized adults ages 18 and older.”	Nationally representative

Table S8: (*continued*) List and description of included survey series.

Source	Link to original data	Brief description	Target sample
Pew: Islam and Christianity in Sub-Saharan Africa	pewrsr.ch/2kQml7z	“The report was funded by generous grants from The Pew Charitable Trusts and the John Templeton Foundation as part of the Pew-Templeton Global Religious Futures Project, which aims to increase people’s knowledge of religion around the world ... Our survey asked people to describe their religious beliefs and practices. We sought to gauge their knowledge of, and attitudes toward, other faiths.”	Nationally representative
Pew: The World’s Muslims—Religion, Politics and Society	pewrsr.ch/3LXoZiu	“This report examines the social and political views of Muslims around the world. It is based on public opinion surveys conducted by the Pew Research Center between 2008 and 2012 in a total of 39 countries and territories on three continents: Africa, Asia and Europe.”	Muslims only
Pulse of Europe	bit.ly/3GssqwD	“The end of communism in the East and the immanent economic integration in the West have unleashed forces of nationalism and ethnicity contained for the last 45 years by the exigencies of the Cold War ... The Times Mirror Survey suggests that contradictory forces are pulling Europe in opposite directions ... Our in depth survey of 13,000 European in nine nations and the Republics of Russia, the Ukraine, and Lithuania finds many reasons to be pessimistic about future developments.”	Nationally representative
Second European Union Minorities and Discrimination Survey	bit.ly/3t5LWcN	The European Union Agency for Fundamental Rights’s “second European Union Minorities and Discrimination Survey (EU-MIDIS II) ... collected information from over 25,500 respondents with different ethnic minority and immigrant backgrounds across all 28 EU Member States.”	Representative of immigrant groups and Roma populations
The Youth, Emotional Energy, and Political Violence: The Cases of Egypt and Saudi Arabia	bit.ly/38O5jjL	“This project intends to explore and explain the values and sociopolitical and cultural attitudes of young Egyptians and Saudis by looking at four general areas of values ... To analyze these four areas researchers conducted face-to-face interviews with 18 to 25 year old youths from Egypt (in the cities of Cairo, Alexandria, and El-Minya) and from Saudi Arabia (in the cities of Jeddah, Riyadh, and Dammam/Khobar). The research was supported by the United States Institute of Peace, the Mellon Foundation, and Eastern Michigan University.”	Representative of youths aged 18 to 25 in certain cities
World Values Survey	bit.ly/3GuX5sZ	“A global research project that explores people’s values and beliefs, how they change over time, and what social and political impact they have. Since 1981 a worldwide network of social scientists have conducted representative national surveys as part of WVS in almost 100 countries.”	Nationally representative

Table S9: List of surveys considered but not included, with reason for exclusion. ♠ indicates that no questions on attitudes toward religious outgroups were asked; ♣ indicates that digitized microdata are not freely available online; ◇ indicates that the surveys were fielded prior to 1980; ♥ indicates duplicates of others survey datasets.

Table S10: Ordinary least-squares regression estimates of the relationship between survey coverage and whether or not a national election involved civilian deaths. The unit of analysis is the national election. In the table header, “m” refers to months. Included in the sample are all national elections from 1982, which is the year of the first survey in this study, to 2020, the end of the NELDA dataset. Standard errors clustered by country are in parentheses.

	Any survey responses within...			Number of survey responses within...		
	3m	6m	9m	3m	6m	9m
	...before or after election					
	(1)	(2)	(3)	(4)	(5)	(6)

Venezuela	World Values Survey Wave 3; World Values Survey Wave 4; World Values Survey Wave 7; International Social Survey Programme Religion III; LatinoBarometro 1998	1996-2021	6,145

Table S13: (*continued*) List of surveys and coverage by country.

Country	Source(s)	Range of years covered	N
Vietnam	World Values Survey Wave 4; World Values Survey Wave 5; World Values Survey Wave 7; International Social Survey Programme Religion IV	2001-2020	5,339
Yemen	World Values Survey Wave 6; Arab Barometer Wave 1; Arab Barometer Wave 5	2007-2018	6,412
Zambia	World Values Survey Wave 5; Pew: Islam and Christianity in Sub-Saharan Africa; Afrobarometer Round 6; Afrobarometer Round 7	2007-2017	5,565
Zimbabwe	World Values Survey Wave 4; World Values Survey Wave 6; World Values Survey Wave 7; Afrobarometer Round 6; Afrobarometer Round 7	2001-2020	7,439

Summary data cited in paper

(Note: this page appears in the output after running the replication code, but not in the published Supplementary Information.)

- Number of observations in the main analysis dataset (`analysis_df_outgroups`): 2576234
- Number of unique respondents in the main analysis dataset (`analysis_df_outgroups`): 1225173
- Number of countries in the dataset (`analysis_df_outgroups`): 150
- Number of unique country-surveys in the main analysis dataset (`analysis_df_outgroups`): 1086
- Years covered by the main analysis dataset (`analysis_df_outgroups`): 1982, 2022
- Proportion of unique respondents in `analysis_df_outgroups` for whom I have the exact survey date: 0.5799712
- Median range of survey dates (number of days) for respondents for whom I lack the exact survey date 30
- Percent of unique respondents in `analysis_df_outgroups` that were interviewed in-person: 0.8915187
- DALP, mean national vote share secured by parties dependent on various forms of religious mobilization 1: 0.2955084
- DALP, mean national vote share secured by parties dependent on various forms of religious mobilization 2: 0.2568802
- DALP, mean national vote share secured by parties dependent on various forms of religious mobilization 3: 0.2568802
